

Snap-On Clothing

Demo cheat-sheet · raw geo → published asset · Maya 2026

● Phase 1 · Install (~30 sec)

- 1 From a file browser, **drag** `install.py` into the **Maya 2026 viewport**.
- 2 Confirmation dialog reports: package copied, starter assets merged, and a **Clothing** button added to a **SnapOnClothing** shelf tab.
- 3 Click the **Clothing** shelf button → the browser opens.
Fallback: Script Editor → `import snap_on_clothing.launch as scl; scl.run()`

● Phase 2 · Point at the library (one-time, ~20 sec)

- 4 **Setup** tab → **Local (working)** → **Browse...** → pick your demo library folder.
This is the only folder scanned. Remote / Sync exists too — mention it, skip it for the demo.

● Phase 3 · Author the jacket — up to skinning (your part)

- 5 New scene → **import the raw geo jacket**. Have the GenHuman rig in-scene as reference if you like — just remember it gets deleted before Publish.
- 6 **Publish** tab → click **Create cloth skeleton**. Rebuilds the canonical GenHuman `cloth_*` joints in-scene — no rig import or duplicate/rename chore.
- 7 Delete any `cloth_*` joints the jacket won't use (legs / feet), keeping the torso / arm / spine joints.

HAND-OFF TO RIGGER

Pass the scene over. The **rigger skins the jacket mesh to the surviving `cloth_*` joints** — this is the skinning portion of the demo. The skinned scene comes back to you for Phase 4.

● Phase 4 · Finish & publish (your part, after hand-back)

- 8 **Publish** tab → set **Type** to coat → click **Scaffold fit rig**. Builds `cloth_fit_ctrl` + a fit lattice + default fit SDKs. Tuning the keyed extremes is optional for a quick demo.
- 9 Fill the form: **Asset name** (e.g. `trench_coat_A`), **Version**, **GenHuman compat** (v03), **Rig version** (hit **Detect**), **Author**, short **Description**.
- 10 Click **Capture thumbnail** → review the playblast preview.
- 11 **Delete the GenHuman rig and its namespace** if any is still in-scene. The published asset must be garment-only — no rig, namespaces, or references.

- 12 Click **Publish ▶**. Saves the .ma + JSON sidecar + thumbnail into the library and runs validation. **Green status line = success.**

● Phase 5 · Prove it snaps on (the payoff shot)

- 13 **Library** tab → **Refresh** → your new jacket appears with its thumbnail and metadata.
- 14 Select the GenHuman rig, select the jacket asset → **Attach ▶** → name the instance (e.g. coat).
- 15 Jacket binds to the body via `connectAttr` only — pose the rig and it follows. **Detach** removes it cleanly. Done.

⚠ Two things that bite you live

Publish refuses while a rig is in the scene — delete it first (step 11).

An asset showing ⚠ **invalid** in the Library grid → open its detail panel; the issues list names the exact validation code and fix.
